

ABSTRACT OF THE DISCLOSURE

5 A snow grooming apparatus is adapted for being drawn by a towing vehicle on a snow surface such as a ski slope. A chassis rides on a pair of runners and supports plural snow shearing blades which are angled for directing snow laterally with respect to the center of the apparatus. An hydraulic actuating system is adapted for vertically positioning a ski centered with respect to the runners. Thus, when this ski is extended downwardly, the chassis and the snow shearing blades are raised to accommodate the snow surface. A pair of wheels are
10 movable to support the chassis above the surface for moving across roads.
